

matrix of silicon oxide and a ~~transparent~~ transparent coat layer consisting of silicate film comprising as its main component silicon oxide including a long chain alkyl group, that is, the transparent conductive layered structure of Example 2.

21  
Please replace the paragraph beginning on page 36, line 18, with the following rewritten paragraph:

Other than the fact that n-octyltrimethoxysilane [ $C_8H_{17}Si(OCH_3)_3$ ] was added to obtain a transparent coat layer forming coating liquid as in Example 1 which includes 0.5 parts by weight of n-octyltrimethoxysilane to 100 parts by ~~weight~~ weight of the inorganic binder ( $SiO_2$ ) in the silica sol liquid, the same treatment as in Example 1 was performed to obtain a glass substrate with a transparent two-layered film composed of a transparent conductive layer comprising noble metal-coated silver microparticles that are conductive microparticles and a binder matrix of silicon oxide and a transparent coat layer consisting of silicate film comprising as its main component silicon oxide including a long chain alkyl group, that is, the transparent conductive layered structure of Example 5.

Please replace the paragraph beginning on page 37, line 15, with the following rewritten paragraph:

Other than the fact that n-octyltrimethoxysilane was added to obtain a transparent coat layer forming coating liquid as in Example 1 which includes 1.0 parts by weight of n-octyltrimethoxysilane to 100 parts by weight of the inorganic binder ( $SiO_2$ ) in the silica sol liquid, the same treatment as in Example 1 was performed to obtain a glass substrate with a transparent two-layered film composed of a transparent conductive layer comprising noble metal-coated silver microparticles that are conductive microparticles and a binder matrix of silicon oxide and a transparent coat ~~layer~~ layer consisting of silicate film comprising as its main component silicon oxide including a long chain alkyl group, that is, the transparent conductive layered structure of Example 6.
